Abstracts

The global Human Atlas and Axis Model market size is predicted to grow from US\$ 12.32 million in 2025 to US\$ 18.36 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

In 2025, global Human Atlas and Axis Model production reached approximately 314,750 Units. The average price is approximately \$40. Human Atlas and Axis Model is an anatomical model of the upper cervical spine used for medical teaching, clinical training, and public education. It focuses on replicating the actual anatomical morphology, spatial location, and joint relationships of the atlas (C1) and axis (C2), and often includes the occipital bone. This model visually demonstrates the structural features of the atlanto-occipital and atlantoaxial joints, particularly emphasizing key anatomical points such as the dens—anterior arch of the atlas—transverse ligament, and the central role of the upper cervical spine in head and neck rotation, flexion, extension, and stability.

Gross Profit Margin Levels

Atlantoaxial models generally fall into the category of educational and medical consumables characterized by 'low material costs + high design and channel value.' Entry-level PVC injection molded parts are primarily produced on a large scale, with a cost structure heavily reliant on mold amortization and assembly/painting, typically resulting in a gross profit margin of 25%–40%. Mid-to-high-end products invest more in bone detail precision, movable joint structures, annotation systems, and packaged solutions (including base, instruction manual, and courseware/digital content integration), resulting in stronger channel pricing power and gross profit margins that can often reach 40%–55%. Models targeting spinal surgery training, featuring 'high-fidelity/lesion modules/composite soft tissue/customizable cases,' can further increase

their gross profit margin to 55%–70% due to the higher proportion of small-batch, customized, and solution-based sales (but this also comes with higher pre-sales technical support and delivery costs).

Industry Drivers

Demand growth is primarily driven by three combined forces: First, medical education is upgrading from 'visual memorization' to 'physical + movable + contextualized teaching,' with the upper cervical spine becoming a frequent and challenging area in classrooms and skills training due to its unique structure and complex kinematics; Second, the trend towards minimally invasive and precise orthopedic/spinal surgery has strengthened the training demand for 'visualization of anatomical pathways and spatial relationships,' driving the penetration of models with higher simulation, greater mobility, detachability, and disease demonstration capabilities; Third, product forms are merging with digital content, for example, some manufacturers are integrating physical models with digital courses/applications (upgrading 'models' to 'learning systems'), increasing repeat purchases and stickiness with schools/institutions.
