The global Human HbA1c Reagent Test Kit market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Glycosylated hemoglobin (GHb) is formed by the slow non enzymatic binding of hemoglobin and glucose, which is irreversible. Its synthesis rate is directly proportional to the glucose concentration in the blood and lasts for 120 days of the lifespan of red blood cells. The level of GHb in the blood represents the average blood glucose level since 120 days. HbA1c, as a subtype of GHb, is a product of the N-terminal valine of the beta chain of red blood cell hemoglobin combined with glucose. It normally accounts for 60% to 70% of the total GHb, and its structure is stable. Therefore, HbA1c can reflect the average blood glucose level in the past three months. The value obtained from testing glycated hemoglobin every 2-3 months can serve as a complete objective indicator reflecting the blood glucose control status over the past few months. Therefore, unlike urine or blood glucose testing, HbA1c is not a value reflecting instantaneous blood glucose levels, but an average indicator reflecting glucose levels in recent months, and its value is not affected by short-term or occasional blood glucose fluctuations. The level of HbA1c has nothing to do with external factors such as blood drawing time, stress reaction, fasting, medication, etc., and the change of short-term lifestyle will not affect the detection results of HbA1c. It can accurately reflect the average blood sugar level of 2-3 months, and is a good monitoring indicator for the diagnosis, screening and treatment of diabetes.
