The global Human High-density Lipoprotein Particles market size is predicted to grow from US\$ 104 million in 2025 to US\$ 233 million in 2032; it is expected to grow at a CAGR of 12.4% from 2026 to 2032.

Human high-density lipoprotein (HDL) particles are a type of natural lipoprotein complex derived from human plasma. They typically have apolipoprotein A-I (ApoA-I) as their core framework, with an outer layer composed of phospholipids and free cholesterol, and an interior rich in cholesterol esters and accompanied by small amounts of triglycerides. These particles primarily function as reverse cholesterol transporters in the body, transporting excess cholesterol from peripheral tissues and blood vessel walls back to the liver for metabolism and clearance. They also possess anti-inflammatory, antioxidant, and endothelial protective biological activities. Due to their preservation of natural conformation and functional properties, human HDL particles are widely used in basic and translational medical research related to cardiovascular diseases, lipid metabolism, inflammatory responses, and drug mechanisms. In 2025, sales volume was 356,000 units, with an average price of \$300, total production capacity of 400,000 units, and a gross profit margin of 82%.
