Human microbiome analysis refers to the process of studying the collection of microorganisms, including bacteria, viruses, fungi, and other microbes, that inhabit the human body. These microorganisms reside in various body sites such as the gut, skin, mouth, respiratory tract, and reproductive organs, forming complex microbial communities known as the microbiome. The human microbiome plays a crucial role in maintaining health and influencing various physiological processes, including digestion, metabolism, immune function, and protection against pathogens. Imbalances or disruptions in the microbiome composition, known as dysbiosis, have been associated with a wide range of health conditions, including gastrointestinal disorders, metabolic disorders, autoimmune diseases, and mental health disorders.

Human microbiome analysis can provide valuable insights into the composition, diversity, and function of microbial communities within the body. It has applications in research, clinical diagnostics, personalized medicine, and the development of microbiome-targeted therapies and interventions aimed at promoting health and treating diseases. Additionally, microbiome analysis may help identify biomarkers of disease risk, monitor treatment responses, and guide interventions to modulate the microbiome for therapeutic purposes.

The global Human Microbiome Analysis market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
