## Abstracts

The global Human Posture Analysis Software market size is predicted to grow from US\$ 730 million in 2025 to US\$ 1142 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Human pose analysis software is a type of analysis tool based on computer vision and artificial intelligence algorithms. It identifies, tracks, and models key points of the human body in videos or images, and analyzes human pose, movement trajectory, and joint motion parameters in real time or offline. This software typically utilizes deep learning-based human skeletal models to quantitatively analyze movements such as standing, walking, running, jumping, and bending. It is widely used in sports training and rehabilitation assessment, industrial safety monitoring, human-computer interaction, intelligent monitoring, and virtual reality scenarios to improve the objectivity, accuracy, and repeatability of motion understanding.

From the demand side, the market growth of human posture analysis software is mainly driven by the demand for 'non-contact, quantifiable behavior understanding'. In the fields of sports training and rehabilitation medicine, traditional motion assessment methods relying on human experience are gradually being replaced by objective analysis based on vision and data; in industrial safety, public space management, and intelligent manufacturing scenarios, enterprises' demand for real-time identification of abnormal human postures, dangerous movements, and fatigue states continues to increase. As the costs of cameras, computing power, and algorithms decrease, human posture analysis is expanding from scientific research and high-end applications to large-scale, routine deployments, and the market application boundaries are constantly broadening.

From the supply and technology evolution perspective, human posture analysis software is evolving from a single algorithm tool to a platform and industry solution. On the one hand, improvements in 2D/3D pose recognition, multi-camera fusion, and edge computing capabilities have significantly enhanced the stability of software in complex lighting, multi-target, and occluded scenarios. On the other hand, manufacturers are building sustainable business models by deeply integrating pose analysis with business systems such as security platforms, motion management systems, industrial MES, or medical assessment systems. Future competition will no longer be limited to algorithm accuracy but will revolve around industry adaptability, data closed-loop systems, and long-term service capabilities. Companies with scene understanding and scalable delivery capabilities are more likely to stand out.
