The global Human Tissue Chips market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Human Tissue Chips (HTCs) are a type of organ-on-a-chip technology and involve the use of human cells arranged on small chips or plates, which replicate the function of human organs and tissues.

HTCs have many advantages over traditional animal models, such as greater efficiency and reduced costs, reduced animal use, and a more precise representation of human physiology. They are a promising new technology that may revolutionize the way we conduct biomedical research and drug development.
