Organ transplantation has evolved to become the prevailing life-saving therapy for patients with end-stage organ failure. Despite remarkable advances on immunological, technical, ethical, and logistical fronts, the shortage of suitable donor organs remains the major challenge to meeting the demand for organ replacement. More people need organs than what is available. On average, seventeen people die each day in the United States waiting for an organ transplant. Finding other sources for organs is critical to save lives. Lung transplantation is the only long-term curative therapy for patients with end-stage pulmonary disease. Over the past decade, increases in the number of lung transplants performed in the United States have largely been offset by likewise increases in the number of patients needing organ replacement, rendering waitlist mortality relatively static. The coronavirus pandemic has also brought about a subset of patients with chronic pulmonary insufficiency and a new indication for lung transplantation, and with it is a renewed urgency for approaches to expand the pool of suitable donor lungs to meet anticipated demand.
