The global Human Vision Sensor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The human vision sensors are Dynamic Vision sensors which work same as the human retina. The human vision sensors work on the principle of the capturing the scene 'at the time they occur.

The popularity of the human vision sensors is increasing due to the fact that the captured data is in the continuous form, on the other hand, the conventional vision sensors capture the scenes in the form of series of frames. These frames consist of a large amount of data in the form of images and other scenes. This information results in the wastage of the RAM, memory access, energy, time, computational power and the disk place to store the information.
