Humectants for food refer to a type of food additive that helps maintain a stable moisture content in food. Humectants refer to food additives that are added to food to help maintain the stability of food moisture. It belongs to the category of quality improvers, mostly referring to phosphates used in meat and aquatic product processing to enhance moisture stability and improve water retention. Condensed phosphates are highly hydrophilic substances that can stabilize the moisture in food. In addition, from 1999 to 2000, my country added two new types of potassium lactate and sodium lactate. At present, there are 10 types of phosphates approved for use in my country, including sodium tripolyphosphate, sodium hexametaphosphate, trisodium phosphate, disodium hydrogen phosphate, sodium dihydrogen phosphate, sodium pyrophosphate, disodium dihydrogen pyrophosphate, calcium dihydrogen phosphate, dipotassium hydrogen phosphate and potassium dihydrogen phosphate. Humectants are developing towards compound types, that is, compound quality improvers are compounded into compound quality improvers according to a certain formula by several quality improvers. This type of compound additive has developed rapidly at home and abroad in recent years, and has been proven to be very convenient and effective. In the United States, carrageenan phosphate additives have been successfully used to produce low-fat, low-salt, low-calorie and high-protein poultry products with health benefits. This type of food additive is mainly used to retain moisture in poultry. It can reduce the salt content in the product by 50% compared to the original. In addition, it can increase the volume of steamed poultry products, maintain the aroma of the product, improve the structure, and improve the cutability. Commonly used moisture retainers are phosphate substances.
