Humic substances like humus, humate, fulvic acid, organic matter, and humin play a key role in soil fertility. Plants grown in soil having an adequate amount of humic substances are healthier, produce higher yields; and have superior nutritional quality. Humins are that part of humic substances that not soluble in acids (low pH) or alkalis (high pH). These are not soluble in water at any pH. Humins are macro organic substances as their molecular weights range from approximately 100,000 to 10,000,000. Out of all the humic substances, humins have relatively low capability to decompose in soil owing to their physical & chemical properties.
