The global Hybrid Composites market size is predicted to grow from US$ 633 million in 2025 to US$ 1295 million in 2031; it is expected to grow at a CAGR of 12.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A composite material (also called a composition material or shortened to composite, which is the common name) is a material made from two or more constituent materials with significantly different physical or chemical properties that, when combined, produce a material with characteristics different from the individual components.

Carbon-fiber/Glass-fiber hybrid enjoys the largest usage share in the Hybrid Composites Market. Hybrid carbon fiber/glass fiber material is a lightweight and high-strength alternative for traditional fiberglass and metal applications in the automotive & transportation, building & construction and other industrial markets. The hybrid material offers the performance benefits of carbon fiber at a cost similar to high-performance fiberglass. Users can get up to 90% of carbon’s benefits at a cost much lower than what they would have to incur in case of using carbon fiber. Parts made out of these hybrid composites provide a high strength to weight ratio and are devoid of corrosion. These have extended service life requiring less maintenance. Their high specific properties meet the needs of applications that lay utmost importance on safety and strength.
