Natural cross-breeding of two different plant varieties produces hybrid seeds. The pollen from one plant's male flower is transferred to the female flower parts of another plant to form a fruit during the cross-breeding process. The seeds that form inside the fruit are referred to as hybrid seeds. In commercial agriculture, hybrid seeds are commonly used to increase crop yields by breeding disease- and climate-resistant plants. Hybrid seeds are highly disease and insect-resistant, increasing yield while also improving crop uniformity and fruit quality.
