The fusing of two or more imaging technologies into a single new form is known as hybrid imaging. When compared to two single photos, the image created with the hybrid imaging system is more powerful in terms of accuracy. Hybrid imaging, in addition to portraying anatomy, allows for in vivo viewing of molecular processes inside broader anatomic material. Ultrasonography, magnetic resonance imaging (MRI), computed tomography (CT), and positron emission tomography (PET) are forms of hybrid imaging technologies (PET). Hybrid imaging systems have resulted from the combination of these technologies.
