The global Hydraulic Decoking Systems market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Hydraulic decoking systems are specialized equipment used in the petroleum refining industry to remove coke deposits that accumulate on the internal surfaces of heavy oil and residue hydrocarbon processing equipment, particularly within delayed coking units. Delayed coking is a process used to convert heavy residual oils into lighter hydrocarbon products such as gasoline, diesel, and petroleum coke. Coke is a solid carbonaceous material that forms when heavy hydrocarbons are thermally cracked in high-temperature and high-pressure conditions. Over time, coke deposits can build up on the walls and tubes of the coking drums and other processing equipment, reducing efficiency and capacity. These deposits need to be periodically removed to maintain the operational efficiency of the coking unit. Hydraulic decoking systems employ high-pressure water jets to break up and remove the coke deposits from the equipment's internal surfaces. Hydraulic decoking systems are critical for maintaining the efficiency and reliability of delayed coking units, which play a crucial role in converting heavy oils into valuable products. Effective coke removal allows the coking unit to operate at its designed capacity and prevents potential operational issues caused by coke buildup.
