Hydraulic Expansion External Casing Packer is a downhole tool used in oil and gas well construction to isolate specific sections of the annulus between the casing and the wellbore. It operates by using hydraulic pressure to expand a metal sleeve or elastomer element outward against the casing wall, creating a reliable seal without requiring mechanical movement or cementing. This type of packer is typically run as an integral part of the casing string and is activated by applying pressure from the surface once it reaches the desired depth. Its robust design allows it to withstand high temperatures and pressures, making it ideal for zonal isolation, well integrity assurance, and applications in challenging or unconventional formations.
