Energy companies use a drilling process known as hydraulic fracturing. It's a process that involves a great deal of water.

Much of the public concern about this process, also known as fracking, has focused on the mixture of water and chemicals that is injected into the ground to fracture open rock and unlock the gas. But experts point out that the most critical risk of pollution from fracking lies in how operators handle the water that comes back out of the ground. This wastewater, a combination of the injected fracking fluid and groundwater, is so saline that it is highly toxic to plants and aquatic life. What's more, its high dissolved solids content can easily overwhelm municipal treatment facilities and contaminate drinking water supplies.

The hydraulic fracturing water treatment solutions are used to treat the wastewater in the hydraulic fracturing process. The specific products include chemicals, equipment and services.

The global market for Hydraulic Fracturing Water Treatment Solutions is estimated to increase from US\$ million in 2021 to reach US\$ million by 2028, exhibiting a CAGR of % during 2022-2028. Keeping in mind the uncertainties of COVID-19 and Russia-Ukraine War, we are continuously tracking and evaluating the direct as well as the indirect influence of the pandemic on different end use sectors. These insights are included in the report as a major market contributor.
