Hydraulic machines are used in many industrial applications to accomplish significant work requiring high amount of mechanical energy in a single stroke. Hydraulic machines perform this work through the use of the high pressure fluid method. The fluid which is typically oil is pumped from a reservoir to the cylinder with the help of hydraulic pump to actuate the piston. Thus, a hydraulic pump needs to generate enough pressure to overcome the pressure induced by the piston load. The pump creates a vacuum at the inlet which draws the fluid from the reservoir to the hydraulic system. Hydraulic gear pump is fixed displacement pump which has a set flow rate.
