The global Hydraulic Rotary Riveting Machine market size is predicted to grow from US\$ 2929 million in 2025 to US\$ 4138 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

The hydraulic riveting machine uses a stamping machine and a special connection die through an instantaneous high-pressure processing process. According to the cold extrusion deformation of the plate material itself, a stress-free internal inlaid dot with a certain tensile and shear strength is formed, so that two or more layers of plates of different materials and thicknesses can be connected. The hydraulic riveting machine has no requirements on the surface of the plate, and the original coating and paint layer on the surface of the plate at the connection point are not damaged. The connection process has a high degree of automation, and can be connected at a single point or multiple points at the same time. It can perform non-destructive connection strength detection and automatic monitoring of the entire process, and has high production efficiency. Rivet-free connection technology is a new connection method that gradually replaces the traditional backward connection process. The hydraulic riveting machine is suitable for the connection of steel plates, stainless steel plates, aluminum plates and non-metallic interlayers. Typical parts connected by hydraulic riveting machines include: roof windows, bumpers, exhaust pipes, fuel tanks, brake covers, doors, instrument frames, engine brackets, engine covers, tailgates, coolers, seats, window regulators, mufflers, refrigerator doors, washing machine housings, fan housings, copier bases, computer housings, dentist machine housings, etc.
