Hydraulic vulcanizing press, hydraulic vulcanizing press is one kind of vulcanizing press. When the hydraulic curing press is working, the lifting cylinder drives the upper die to rise along the guiding column to form a cavity in the frame, the tire loading device turns in to load the tire, the upper and lower rings of the central mechanism rise, the tire embryo is positioned, the tire loading device unloads the tire and then withdraws, the lifting cylinder drives the upper die to descend along the guiding column to close the mold, the tire embryo is shaped and the mold is closed in place, and the required closing force is generated under the action of the four short-stroke force cylinders under the mold seat. After the tire is vulcanized, the pressurizing cylinder unloads the pressure, the lifting cylinder drives the upper die to rise, and the tire comes out of the upper die. After the upper die rises into place, the capsule of the central mechanism rises, the tire comes out of the lower die, the upper and lower rings of the central mechanism fall, and the capsule is put into the capsule.
