According to our LPI (LP Information) latest study, the global Hydro Energy market size was valued at US\$ million in 2023. With growing demand in downstream market, the Hydro Energy is forecast to a readjusted size of US\$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Hydro Energy market. Hydro Energy are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Hydro Energy. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Hydro Energy market.

Fossil fuel based power generation is the most popular form of power generation in the world. However, depleting reserves of fossil fuels has prompted the industry to shift to renewable sources. The growing energy demand on account of growing global population coupled with the need to reduce reliance on conventional power generation has been prompting the industry to use renewable power sources. One of the most popular renewable power generation technologies includes hydropower which does not cause any greenhouse gas emissions and toxic waste. After building a dam and installation of equipment the source of energy i.e. flowing water is free therefore making hydropower is one of the cheapest ways to generate electricity. It is one of the cleanest fuel sources which get renewed regularly by rainfall and snow. Hydropower is readily available because according to the demand and requirement the flow of water can be

controlled through turbines by engineers and the reservoirs may also offer recreational opportunities and activities such as boating and swimming.

Hydro power industry comprises companies that operate by producing, generation, supply and distribution of power generated from hydro sources, that is the electricity is generated at dams and other water streams that have high currents. Firms in this industry operate facilities that use water to generate hydroelectric and renewable electricity (other than wind power and solar power). Industry players also use renewable energy sources including wood, municipal waste, landfill gas, biomass and geothermal energy to generate electricity. Data is sourced from the Energy Information Administration and the US Census Bureau and does not include government-owned facilities.
