The global Hydroacoustic Direction Finder market size is predicted to grow from US$ 434 million in 2025 to US$ 559 million in 2031; it is expected to grow at a CAGR of 4.3% from 2025 to 2031.

A hydroacoustic direction finder is an instrument specifically used to search for and determine the direction of sound signals emitted by underwater targets (such as moving ships, active hydroacoustic stations, etc.). The working principle of the hydroacoustic direction finder is mainly based on the characteristics of sound wave propagation in water, and the direction of the sound source is determined by measuring the time difference of the sound wave reaching the sound collector or the difference in radiation intensity. When an underwater target emits a sound signal, the receiver of the hydroacoustic direction finder will receive these signals and calculate the direction of the target based on the time and intensity difference of the signal arrival.

With the continuous development of technology, the performance of hydroacoustic direction finders is also constantly improving. In the future, hydroacoustic direction finders may develop in the direction of higher accuracy, longer detection distance and stronger anti-interference ability. At the same time, with the widespread application of underwater unmanned systems, hydroacoustic direction finders will also be more closely integrated with these systems to provide more accurate and reliable technical support for underwater detection and positioning.
