Calcium aluminum hydrotalcite, also known as hydrotalcite, is an anionic clay belonging to layered bimetallic hydroxides (LDHs). Due to its unique structure and composition, as well as the controllability of its structural composition, it possesses some special properties, making it a new functional material with great potential and attractive prospects in flame retardancy, adsorption, ion exchange and catalysis, as well as selective adsorption and catalytic properties like zeolite. It also has heat resistance, radiation resistance, acid and alkali resistance. Hydroaluminate calcium carbonate has significant advantages over magnesium aluminum hydrotalcite. From a structural analysis, the compound contains calcium, which has superior long-term thermal stability compared to magnesium; There are also a large number of hydroxide ions in boehmite, which can neutralize and absorb the hydrogen chloride produced by PVC degradation, thereby serving as a long-term heat stabilizer. Therefore, as the main thermal stabilizing component of PVC resin, calcium aluminate hydrate has better application prospects than traditional hydrotalcite.

The global Hydrocalumite market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
