A hydrogel-based drug delivery device refers to a biomedical technology that uses hydrogels as matrices or carriers for controlled and targeted release of therapeutic agents. Hydrogels are three-dimensional networks of cross-linked hydrophilic polymers capable of absorbing and retaining large amounts of water. These devices are designed to encapsulate drugs or biomolecules, providing a stable environment for sustained or localized release in response to physiological stimuli such as pH, temperature, or enzymatic activity. Hydrogel-based drug delivery systems offer advantages like enhanced bioavailability, reduced systemic side effects, and prolonged therapeutic efficacy. They are utilized in various medical applications including wound healing, tissue engineering, cancer therapy, and treatment of chronic diseases, demonstrating versatility and potential for personalized medicine approaches.
