The global Hydrogen Energy Resource Exploration market size is predicted to grow from US\$ 550 million in 2025 to US\$ 4275 million in 2032; it is expected to grow at a CAGR of 34.2% from 2026 to 2032.

Hydrogen resource exploration refers to the systematic search, identification, evaluation, and resource prediction of naturally generated or long-term accumulated hydrogen resources underground through geological, geochemical, geophysical, remote sensing, and drilling technologies. Its core objective is to identify hydrogen generation mechanisms, migration pathways, and trap structures in the underground lithosphere, and to determine exploitable hydrogen-rich areas through seismic exploration, gas anomaly monitoring, isotope analysis, and exploratory drilling. This provides a fundamental geological basis and resource guarantee for the future commercial exploitation and energy utilization of hydrogen resources.

Hydrogen energy resource exploration is in the early stages of a breakthrough in the global energy system and is considered a potential next-generation field of underground clean energy discovery after oil and gas. Its development prospects are mainly driven by energy transition, carbon neutrality goals, and the cost pressure of traditional hydrogen production. As research continues to confirm the existence of large-scale, continuously generated natural hydrogen systems in the Earth's crust, and as surface hydrogen anomalies and preliminary commercial drilling projects have appeared in Australia, Europe, and North America, this field is gradually moving from the 'geological hypothesis verification stage' to the 'resource evaluation and exploratory development stage.' If large-scale commercial exploitation is successfully achieved in the future, natural hydrogen may form an energy alternative path similar to the shale oil and gas revolution, becoming an important supplementary source of low-carbon hydrogen

supply and driving the rapid expansion of the geophysical exploration, underground imaging technology, AI geological modeling, and deep drilling industry chain. However, it still faces key challenges such as high resource uncertainty, complex reservoir distribution, and unverified economic recoverability.

United States market for Hydrogen Energy Resource Exploration is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Hydrogen Energy Resource Exploration is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
