The global Hydrogen Powered Boat market size is predicted to grow from US\$ 636 million in 2025 to US\$ 1239 million in 2032; it is expected to grow at a CAGR of 11.0% from 2026 to 2032.

Hydrogen-powered ships are zero-emission or low-emission vessels powered by hydrogen fuel cells or hydrogen combustion systems. They generate propulsion energy through electrochemical reactions or direct combustion, with water as the primary emission. These vessels are suitable for passenger ferries, leisure yachts, patrol boats, and inland waterway transportation, representing a crucial technological path for the shipping industry to achieve decarbonization and decarbonization. The hydrogen-powered ship industry chain includes upstream components such as hydrogen storage tanks, fuel cells, power management systems, motors, control electronics, and lightweight hull materials; midstream components are ship manufacturers that integrate propulsion systems, energy storage, safety systems, and ship structures; and downstream applications encompass commercial ferries, leisure navigation, port operations, tourist vessels, and government or research fleets. Supporting services include hydrogen refueling infrastructure construction, system maintenance, safety certification, and operational training. The gross profit margin of major companies in the industry ranges from 25% to 45%.

The Hydrogen Powered Boat market is driven by global decarbonization policies, tightening maritime emission regulations, and investment in green transportation. Early adoption is concentrated in short-range ferries and demonstration projects where zero-emission operation provides regulatory and environmental advantages. Technological advances in fuel cells, hydrogen storage, and marine safety systems are improving feasibility and reducing costs. As hydrogen infrastructure expands and production

scales up, hydrogen powered boats are expected to experience rapid growth, especially in inland waterways and coastal transport.
