Hydrogen recirculation ejectors are passive devices used in fuel cell systems to redirect unused hydrogen from the anode exhaust back into the anode inlet, enabling continuous use of hydrogen fuel and improving overall system efficiency. Operating on the Venturi effect, these ejectors use the pressure of incoming fresh hydrogen to create a vacuum that draws the anode off-gas into the recirculation loop—without any moving parts or external power. This design enhances reliability, reduces maintenance, and eliminates the need for mechanical pumps, making them especially suitable for automotive and stationary fuel cell applications where simplicity, durability, and energy efficiency are critical.
