The hydrogenation heat exchanger (Hydrogen Heat Exchanger) is a kind of equipment used for heat energy transfer in the hydrogenation process, which is used to transfer heat from one fluid to another fluid, so as to realize heat energy recovery and energy efficiency improvement in the hydrogenation process.

Hydrogenation heat exchangers are usually composed of multiple pipes or tube bundles, one of which flows inside the pipe, while the other flows outside the pipe, and heat transfer is achieved through wall heat transfer. In the hydrogenation process, there are usually two fluids involved in heat exchange, one of which is a high-temperature

hydrogenation medium, and the other is a low-temperature circulating cooling medium.
