The heat exchanger of the hydrogenation unit is an important equipment in the hydrogenation process of petroleum refining. It is used to achieve heat exchange between the reaction fluids during the hydrogenation process. It increases the temperature of the feed by exchanging heat between the fluid after the high-temperature reaction and the feed fluid, thereby saving energy and improving the reaction efficiency. The heat exchanger of the hydrogenation unit is usually designed as a heat exchanger under high-pressure and high-temperature operating conditions. It can handle process conditions with strong corrosiveness and large temperature and pressure fluctuations. It is a key equipment to ensure the efficient and stable operation of the hydrogenation process.

United States market for Hydrogenation Unit Heat Exchanger is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
