The global Hydrogenerator market size is predicted to grow from US\$ 2757 million in 2025 to US\$ 3921 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

In 2025, global hydrogenerator production reached approximately 1281 units, the average price is 2200 k usd/unit. Hydrogenerator is a rotating motor which converts mechanical energy of water flow into electric energy. It is the core equipment of hydraulic power station. Its basic working principle is that water flow impinges or drives hydraulic turbine to rotate. The main shaft of hydraulic turbine drives the rotor of generator directly or through transmission device. The excitation winding on rotor is connected with DC to generate rotating magnetic field. The stator winding is cut to induce AC electromotive force, and then output electric energy. It has the characteristics of rapid start, good peak shaving performance and long service life. It is the key power equipment to realize the efficient utilization of hydropower, a clean renewable energy.

Market Concentration and Key Players:

Internationally, the market concentration of hydrogenerators is relatively high, mainly concentrated in developed countries in Europe and America. For example, Watt&Sea and WEG and other large manufacturers; from the domestic point of view, hydrogenerators still have a lot of room for development.

Manufacturing Processes and Market Trends:

The core of hydrogenerator manufacturing technology lies in the machining and integral assembly of large precision parts. The key starts from the manufacture of core parts. The rotating shaft and rotor center body need to be forged by large forgings and precisely machined by heavy machine tools. After the magnetic yoke punching sheets

are stacked, they are heated and sleeved into the rotating shaft and tightened by torque wrenches. After the stator base is divided into segments, it is welded and machined on site. The stator core is punched out by cold-rolled silicon steel sheets and laminated. The stator winding coils are wound, formed and laminated. After insulation treatment, embed the core slot and complete the offline connection. The overall assembly shall be carried out in the installation room. Adjust the axis through turning and make the rotor fall into the stator cavity smoothly. Finally, complete the complete set of electrical test and type test in the factory or construction site after bearing installation, thrust load commissioning and ventilation cooling system integration to ensure the stability and reliability of the unit.

The market trend closely follows the global energy transformation and hydropower development. At present, large-scale hydropower development focuses on high-head and large-capacity units, continuously improving the efficiency and reliability requirements of units. Digitalization and intelligence have become clear directions. Predictive maintenance and performance optimization of units can be realized by installing condition monitoring sensors and constructing digital twin models. Capacity expansion and modernization of a large number of stock units are important markets. By replacing runners, Stator winding and upgrade control system can effectively improve output and operation flexibility, progress in materials and cooling technology to promote the development of units to larger unit capacity, while enterprises actively participate in overseas hydropower projects, from equipment supply to provide overall solutions to expand.
