The global Hydrophone Calibrator market size is predicted to grow from US\$ 40.38 million in 2025 to US\$ 83.52 million in 2032; it is expected to grow at a CAGR of 11.2% from 2026 to 2032.

A hydrophone calibrator is a special device used to quickly calibrate the sensitivity of a hydrophone under non-free field conditions. A hydrophone is a transducer that converts underwater acoustic signals into electrical signals, and a hydrophone calibrator is an important tool to ensure that the hydrophone can accurately measure sound pressure. Before using a hydrophone for quantitative research on the sound field or underwater acoustic signal measurement, it must be calibrated to obtain its sound pressure sensitivity. The sound pressure sensitivity parameter is defined as the ratio of the output voltage to the received sound pressure, and this parameter is crucial to ensuring the accuracy of the measurement results.
