Hydrotreating catalysts, also known as hydrotreating catalysts, are chemical substances used in the hydrotreating process, a type of refining operation employed in the petroleum and petrochemical industries. These catalysts facilitate the removal of sulfur, nitrogen, oxygen, and other impurities from various hydrocarbon feedstocks, such as crude oil, petroleum fractions, and intermediate refinery products, to produce cleaner, higher-quality fuels and chemical intermediates.

The growing demand for ultra-low sulfur fuels in the automotive and transportation industries was driving the need for advanced hydrotreating catalysts capable of achieving stringent sulfur removal targets, ensuring compliance with global emissions regulations, and supporting the production of cleaner and more environmentally friendly transportation fuels.
