The global Hydroxy Trace Minerals market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Hydroxy trace minerals are a particular category of minerals, characterised by the presence of covalent bonds that constitute a single matrix with a crystalline structure that has an excellent molecule stability and an uniform distribution of particles. Hydroxy trace minerals are characterized by their strong intramolecular bonds in comparison to the weak ionic bonds of sulphates and most of the organic minerals. Strong bonds provide excellent stability and low reactivity in the rumen and a slow release effect in the intestinal tract.
