The global Hydroxyethylcellulose (HEC) market size is predicted to grow from US\$ 768 million in 2025 to US\$ 1051 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Hydroxyethylcellulose (HEC) is a cellulose ether with hydroxyethyl substituents introduced into the cellulose main chain. It is a non-ionic polymer that is easily soluble in water. Its typical functions include thickening, film-forming, water retention, suspension stability, and rheological adjustment. Therefore, it is widely used in formulation systems such as water-based coatings and coatings, building materials, daily chemical and cosmetics, oil and gas drilling fluids, adhesives, and pharmaceuticals. In 2025, global Hydroxyethylcellulose (HEC) production reached approximately 175.32 K MT, with an average global market price of around US\$ 4,477 per MT.

The demand for hydroxyethylcellulose (HEC) is still driven by the environmental protection upgrading of water-based building coatings and building materials systems in the medium and long term. At the same time, the application of personal care and oilfield chemicals provides structural growth for HEC. The focus of industry competition is shifting from simple price to dissolution rate and anti agglomeration appearance, consistency of batch viscosity, low gel particles and low impurity control, as well as the application formula service capability for different systems.
