The global Hydroxypropyl Starch (E1440) market size is predicted to grow from US\$ 186 million in 2025 to US\$ 274 million in 2032; it is expected to grow at a CAGR of 5.8% from 2026 to 2032.

Hydroxypropyl starch is a type of modified starch used as a food additive with E-number 1440. Hydroxyl propyl starch is not absorbed intact by the gut, but are significantly hydrolyzed by intestinal enzymes and then fermented by intestinal microbiota.

Modified starch means that in order to improve the performance of starch and expand its application range, physical, chemical or enzymatic treatment is used to introduce new functional groups on starch molecules or change the size of starch molecules and the nature of starch granules, so as to change the natural characteristics of starch (e.g., pasting temperature, thermal viscosity and its stability, freezing and thawing stability, gelation, film-forming properties, transparency, etc.) and make it more suitable for the requirements of certain applications. This kind of starch after secondary processing, change the nature of the starch collectively known as modified starch. Compared with ordinary starch, modified starch has the characteristics of low pasting temperature, high transparency, high solubility, strong gelatinization, good freeze-thaw stability, low viscosity, low and high temperature resistance, and therefore it is widely used in the food field. By the sustained economic growth, expanding industrial production scale, and the modified starch industry's own production and R & D technology improvement, the overall consumer demand for modified starch is a growing trend, in 2022, the global modified starch market size of about 12.583 billion U.S. dollars.
