Sanitary single seated valves are a type of globe valves used to shut off or change the direction of fluid flow in high-pressure applications. They are preferred because of their simple design: a movable disc-type element with unique designed seat is maneuvered to seal the port on well treated body. Single seated valves as the name suggest only feature one seat. Single seated valves have a unique designed seat in plug that can be manipulated into open or closed position using a plug-headed stem.

Sanitary single-seat valve, also known as sanitary single-seat valve, is a kind of valve equipment used in food, pharmaceutical, cosmetic and other hygienic fields. They are designed to meet stringent hygiene requirements to ensure product quality and safety during production. These valves are commonly used to control the flow of fluids (liquid

or gas) in piping systems. Sanitary single-seat valves are usually made of corrosion-resistant materials such as 316L stainless steel to ensure that the surface of the valve is smooth, easy to clean, and will not pollute the fluid. These valves are designed with no dead legs and no leaks to avoid bacterial growth and cross-contamination. The internal channel of the valve is smooth, and it is not easy to accumulate residual substances. Sanitary single-seat valves are easy to clean and maintain, and usually have a detachable structure, making cleaning, disinfection and maintenance more convenient.
