The global Hyper-Spectral Imaging (HSI) Equipment market size is predicted to grow from US\$ 162 million in 2025 to US\$ 388 million in 2031; it is expected to grow at a CAGR of 15.6% from 2025 to 2031.

Hyper-Spectral Imaging (HSI) Equipment combine the power of digital imaging and spectroscopy to provide more detailed scene information than regular color cameras. A normal color camera only acquires three different spectral channels corresponding to the red, green, and blue visual primary colors. Hyperspectral cameras can capture the light intensity (radiation) of a large number (usually tens to hundreds) of continuous spectral bands. Thus, each pixel in the image contains a continuous spectrum (radiation or reflection) and can be used to characterize objects in the scene with high precision and detail. Hyperspectral imaging results in greatly improved ability to classify objects in the scene based on its spectral properties.

Global key players of Hyper-Spectral Imaging (HSI) Equipment include Specim, Headwall Photonics, IMEC, Norsk Elektro Optikk A/S, Cubert, etc. The top five players hold a share over 45%. United States is the largest market, which has a share about 40%, followed by Europe and China with a market share of 22% and 14%, respectively. In terms of product type, Visible/Near Infrared (VNIR) is the largest segment, occupied for a share of 48%. And in terms of application, National Defense Security is the largest segment, which has a share about 20%.
