The report requires updating with new data and is sent in 48 hours after order is placed.

Hyperkalaemia is a disease in which the levels of potassium are higher than normal. Minerals including potassium are essential for the body and are required for the normal functioning of the cells. The kidneys are responsible for the maintenance of potassium content in the body by balancing its intake as well as its excretion. If the intake of potassium is higher than the ability of the kidney to excrete it or if the functioning of the kidney decreases, hyperkalaemia is likely to occur.
