## Abstracts

The global Hyperspectral Camera market size is predicted to grow from US\$ 189 million in 2025 to US\$ 523 million in 2032; it is expected to grow at a CAGR of 15.8% from 2026 to 2032.

Hyperspectral cameras are optical imaging devices that overlay one-dimensional continuous spectral information onto two-dimensional geometric spatial imaging, forming a 'spatial-spectral' data cube. They achieve nanometre-level spectral resolution (e.g., 300 channels across 400–1000 nm), Each pixel contains complete spectral characteristics, enabling precise material composition identification and detection of minute variations. Core applications span scientific research, industrial quality control, remote sensing, agriculture, and healthcare, fulfilling demands for precise analysis and non-destructive testing.

Global hyperspectral camera sales reached 7,613 units in 2025, with an average price of US\$25,350 per unit.

### Development Trends

Transitioning from research to industrial online applications: Scenarios demanding real-time stability—such as recycling sorting, food/pharmaceutical quality control, and ore grading—are driving full-system engineering and mass production.

Small-footprint/low-power/easy-integration (SWaP): Increased availability of miniaturised cameras/modules for production lines and mobile platforms (robots, drones).

Snapshot and 'video-grade hyperspectral imaging': Achieving higher frame rates and reduced motion artefacts through pixel mosaic filtering, light field/computational imaging, and other approaches, facilitating real-time online AI recognition.

Multi-band fusion and co-viewing fields (e.g., VNIR+SWIR): Greater emphasis on cross-band consistency, calibration, and co-registration to enhance quantitative reliability.

Integrated delivery of 'camera + algorithm + software': Industry users increasingly purchase 'usable classification/detection results' rather than raw data cubes; manufacturers are increasing investment in both software and hardware chains.

Band expansion towards both ends of the spectrum (deep ultraviolet, thermal infrared): For more differentiated applications such as thin films/coatings, gas identification, and mineral/thermal radiation characteristics.
