Hyperspectral Imaging Satellite is an advanced remote sensing satellite that has the ability to simultaneously obtain detailed information on surface materials in different spectral bands. It can record spectral data in dozens or even thousands of bands from ultraviolet to mid-infrared, which is different from traditional. Compared with other imaging technologies, this satellite is characterized by its high spectral resolution, which can identify extremely subtle differences in spectral characteristics. Due to its ability to capture the unique spectral fingerprint of a substance, Hyperspectral Imaging Satellite has significant advantages in substance identification and analysis. It is able to provide extremely fine data over a wide range of observations, which enables scientists and research institutions to gain a deeper understanding. The composition and distribution of surface materials. In addition, the superior data acquisition capabilities of this satellite also make it widely used in many fields such as environmental monitoring, resource surveys, disaster assessment, etc. The detailed spectral information it provides provides valuable data support for studying the earth system.
