The scar is elevated above the skin and remains hyperemic. Excessive fibrous tissue is classified as either a keloid or a hypertrophic scar. Kischer and Brody declared the collagen nodule to be the identifying structural unit of hypertrophic scars and keloids.

A key driver in the hypertrophic and keloid scar treatment market is the growing demand for effective and minimally invasive scar management options. These scars can result from various causes, including surgery, trauma, and acne, and their cosmetic and functional impact drives the need for advanced treatments. However, a significant challenge in this market is the variability in patient response to available treatments.

Scar management is often personalized, and finding the right treatment that yields consistent and satisfactory results for all patients remains a challenge. Developing standardized and universally effective treatments while considering individual patient factors is essential for addressing this challenge and advancing scar treatment options.
