Hypervisor is a firmware, software or hardware which is synonymously used for the term virtual machine monitor (VMM) that creates and runs machines virtually. Hypervisor is installed on server hardware in order to control and manage the guest operating systems running on the host machine. The primary function of a hypervisor is to render the requirements of guest operating system and efficiently be able to manage the process such that the instances of multiple operating systems do not interfere with one another. Increasing application in virtualization technology is incorporated in enterprises for performance and safety applications. Hypervisor virtualizes computer hardware, and it runs multiple operating systems. It can be also generally called as virtual machine manager. It has the potential to virtualize hardware and oversee many virtual machines. It is operated on one host computer, and it lets users run multiple operating systems.

These operating systems are also known as guest operating systems. Virtualization software solutions can make sure that the hardware is used efficiently to get more computing work done at all times.

Increasing application in virtualization technology is incorporated in enterprises for performance and safety applications. Adoption of virtual machines in aerospace and defense sectors is another factor which is expected to have a positive impact on the growth of global hypervisor market. Rapid growth in the usage of smartphones and tablets is among the other factors driving the growth of global hypervisor market.
