Hypothyroidism is a condition characterized by an underactive thyroid gland, which leads to a decrease in the production of thyroid hormones. The primary treatment for hypothyroidism is hormone replacement therapy, typically in the form of synthetic thyroid hormones.

It's important to note that treatment for hypothyroidism is individualized, and the dosage and type of medication may vary depending on factors such as age, overall health, and the severity of the condition. Regular monitoring of thyroid hormone levels through blood tests is essential to ensure the dosage is appropriate and to make any necessary adjustments.
