Hypromellose for Hot Melt Extrusion is a semi-synthetic polymer that can form a reversible gel at high temperatures, primarily used as a binder or thickener in hot melt extrusion processes. It provides good plasticity during hot melt extrusion and retains its shape after cooling. Upstream production mainly involves basic raw materials, the core of which is refined cotton (or wood pulp cellulose), the natural polymer backbone for producing cellulose ethers. It also includes etherifying agents required for synthesis, such as propylene oxide.

Global sales in 2024 were approximately 6,000 tons, with an average market price of about \$5 per kilogram. The size of a single production line varies depending on the production process and investment scale. Industry gross profit margins range from 20% to 35%.
