## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The integrated circuit aging test system is a test equipment used to evaluate the stability and reliability of integrated circuits (ICs) under long-term use or specific environmental conditions. The system usually includes a series of test equipment, controllers, sensors and data acquisition devices, which can simulate various stress sources that the IC may encounter in actual applications, such as temperature, humidity, voltage, etc. By subjecting ICs to continuous or accelerated aging testing, factors that may lead to performance degradation, malfunction, or failure can be detected and the IC's life and stability can be assessed. Integrated circuit aging test systems play an important role in the electronic equipment manufacturing and reliability assessment process, helping to improve product quality and reliability.
