The global Icteric Detector market size is predicted to grow from US\$ 118 million in 2025 to US\$ 127 million in 2032; it is expected to grow at a CAGR of 1.3% from 2026 to 2032.

Icteric Detector refers to specialized medical devices used for the quantitative or qualitative analysis of bilirubin concentrations in the human body. They are primarily used for neonatal jaundice screening, auxiliary diagnosis of hepatobiliary diseases, and monitoring of treatment effectiveness. Based on their detection principles and usage scenarios, they are divided into two core categories: handheld percutaneous bilirubin testing and desktop blood testing.

The core drivers of the development of Icteric Detector are twofold: first, the high incidence of neonatal jaundice creates a rigid clinical demand. The prevalence of jaundice in full-term and premature infants makes non-invasive, rapid testing equipment essential for neonatal health protection; second, policy-driven improvements in the neonatal disease screening capabilities of primary healthcare systems, with relevant regulations recommending percutaneous bilirubin testing, coupled with the widespread adoption and upgrading of equipment in primary healthcare institutions, continuously release market demand.

In 2025, global Icteric Detector reached approximately 59139 Units, with an average global market price of around 2041 USD per Unit.

The upstream core components of Icteric Detector mainly include light sources, photoelectric sensors, filters, microprocessors, etc. Typical suppliers include Hamamatsu Photonics, Nichia, Edmund Optics, Thorlabs, etc. The downstream applications are mainly in hospitals, clinics, community service centers, and postpartum care centers.

The single-line production capacity of Icteric Detector varies significantly depending on the manufacturer's scale, product positioning, and production model. Typically, the single-line production capacity of regular products is over 2,000 units, and the industry gross profit margin is in the range of 40%-60%.

Icteric Detector is a core medical device focused on the precise detection of bilirubin concentrations in the human body. It primarily covers two categories: desktop blood testing and handheld transcutaneous testing, providing crucial clinical evidence for neonatal jaundice screening, diagnosis of hepatobiliary diseases, and monitoring of treatment effectiveness. The desktop blood testing device, using blood samples as the testing object, has become a core laboratory device for clinically diagnosing jaundice types and assessing the degree of hepatobiliary function damage due to its high specificity and precise quantitative analysis capabilities. The handheld transcutaneous testing device, based on the principle of optical reflection, achieves non-invasive testing, quickly obtaining test results without blood collection. It is suitable for point-of-care screening, primary healthcare screening, and other immediate testing scenarios. The two devices complement each other, comprehensively covering testing needs across all scenarios from professional diagnosis and treatment to primary care screening.

Icteric Detector leverages its product category differentiation to precisely address various pain points in current clinical testing: the non-invasive and rapid nature of handheld percutaneous devices effectively solves the problems of low neonatal blood collection compliance and insufficient testing efficiency in primary healthcare settings, avoiding the infection risks and cumbersome procedures associated with traditional invasive testing; while the high-precision quantitative capabilities of benchtop blood analyzers overcome industry bottlenecks such as difficulty in differentiating complex types of jaundice and insufficient sensitivity in early screening for hepatobiliary diseases. Currently, the increasing global emphasis on neonatal health management is driving a rigid increase in screening demand; rising prevalence of chronic liver disease and related diseases is expanding the volume of clinical testing; the implementation of tiered medical services is accelerating the upgrading of primary healthcare equipment; and the higher requirements for testing accuracy and efficiency under the concept of precision medicine constitute the core driving force for industry development, providing ample space for equipment technology iteration and market expansion.

In the future, the Icteric Detector industry will unleash its continued growth potential along with medical technology innovation and the expansion of application scenarios. From a technological perspective, intelligent upgrading will be the core direction. By

integrating artificial intelligence algorithms and IoT technology, equipment will achieve real-time analysis of test data, anomaly warnings, and cloud connectivity, further improving the accuracy and intelligence of testing. In terms of product form, portable devices will evolve towards smaller sizes and multi-indicator testing, while desktop devices will upgrade towards high throughput and automation to better adapt to the specific needs of different scenarios. Application scenarios will extend from traditional medical institutions to family health management, primary community services, and emerging medical fields. Simultaneously, driven by the balanced development of global medical resources, it will gain broader penetration in emerging markets. As key equipment for safeguarding liver and gallbladder health and neonatal life safety, the Icteric Detector industry will continue to grow in the wave of healthcare industry upgrading, and its development prospects are promising.
