Abstracts

The idler arm and pitman arm work in tandem to link the steering gear to the centre link, creating a parallel steering linkage that ensures the wheels remain in-sync.

Essential steering components located in the steering box, the idler arm and pitman arm are both key parts of the linkage mechanism that translates the driver's rotation of the steering wheel into the left and right movement of the car's wheels. The two arms work together on opposite sides of the centre link but have slightly different functions. The idler arm is attached to the frame or subframe of the car and uses a pivoting action to support the right-hand side of the centre link. The pitman arm performs the role of converting angular motion into linear motion in order to steer the wheels. As with most moving mechanical parts, idler and pitman arms are subject to wear and tear.

The global market for Idler and Pitman Arms is estimated to increase from US\$ million in 2021 to reach US\$ million by 2028, exhibiting a CAGR of % during 2022-2028. Keeping in mind the uncertainties of COVID-19 and Russia-Ukraine War, we are continuously tracking and evaluating the direct as well as the indirect influence of the pandemic on different end use sectors. These insights are included in the report as a major market contributor.
