## Abstracts

The global Image Fiber market size is predicted to grow from US\$ 239 million in 2025 to US\$ 429 million in 2032; it is expected to grow at a CAGR of 8.6% from 2026 to 2032.

Image transmission fiber is an imaging fiber material formed by fusion molding a large number of highly uniform microfibers arranged in fixed relative positions. It is used to achieve optical image transmission without relying on electronic sensors and maintains spatial pixel correspondence under bending or long-distance conditions. It is widely used in medical endoscopes, industrial endoscopic inspection, aerospace structural inspection, nuclear industry radiation environment monitoring, military reconnaissance, and scientific research optical imaging. In 2025, global sales of image transmission fiber were approximately 7.2 million meters, with an average unit price of approximately US\$34 per meter and a capacity utilization rate of approximately 78%. The upstream mainly consists of high-purity quartz glass and preforms, drawing and annealing coating materials, precision grinding and polishing consumables, sheathing and structural packaging materials, as well as suppliers of microstructure inspection equipment and tooling fixtures. The downstream includes endoscope manufacturers and module manufacturers, industrial endoscopic and non-destructive testing equipment manufacturers, aerospace and military equipment companies, nuclear power and radiation detection system integrators, and optical instrument and scientific research equipment manufacturers. The industry's gross profit margin is approximately 41%. In the product cost structure, quartz preforms and glass materials account for approximately 28%, optical fiber drawing and annealing processes account for approximately 18%, imaging bundle alignment and fusion molding account for approximately 16%, end face grinding and polishing account for approximately 10%, sheathing and structural packaging account for approximately 8%, testing and yield losses account for approximately 7%, R&D and process platform amortization account for approximately 6%, and logistics, management, and sales expenses account for approximately 7%. The demand list mainly includes medical endoscope imaging,

industrial endoscopy and pipeline inspection, aerospace engine and structural inspection, nuclear power equipment inspection, military and aerospace optical imaging systems, and scientific research optical imaging and experimental platforms. The downstream customer list includes endoscope manufacturers and core component suppliers, industrial testing equipment manufacturers, aerospace and military units, nuclear power operators and testing institutions, and optical instrument and research institutions. Business opportunities arise from the increasing demand for in-service testing in minimally invasive medical and industrial applications, the increased inspection frequency due to aging infrastructure and critical equipment, advancements in high radiation resistance and high fiber core density manufacturing processes, and changing consumer demands for higher resolution, smaller diameter, greater flexibility, and higher reliability.
