An imaging barcode scanner is a barcode reading device that uses a camera or image sensor to capture barcode images and decode them through digital signal processing technology. It can identify one-dimensional and two-dimensional codes, as well as bad barcodes such as poor printing quality, blur, deformation, and stains. The advantages of image barcode scanners are fast scanning speed, wide recognition range, long reading distance, strong adaptability, and not affected by light and background. The working principle of the imaging barcode scanner is: first, the scanner illuminates the barcode through a built-in or external light source to enhance the reflectivity and contrast of the barcode; then, the scanner's camera or image sensor converts the image of the barcode into an analog electrical signal. And converted into a digital signal through an analog-to-digital converter; then, the scanner's image processor performs filtering, enhancement, segmentation, correction, etc. on the digital signal to obtain a clear barcode image; finally, the scanner's decoder encodes the barcode according to the According to the rules, the barcode image is decoded to obtain the information represented by the barcode.
