The global Imaging Fibre market size is predicted to grow from US$ 89 million in 2025 to US$ 159 million in 2031; it is expected to grow at a CAGR of 10.2% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Imaging fibre refers to a type of optical fibre specifically designed for the high-resolution, lossless transmission of images. It consists of a tightly packed array of optical cores, each functioning as an independent pixel, enabling accurate image transmission from the distal to the proximal end. Imaging fibres typically include an imaging core region, cladding, and a protective coating. They are characterized by high pixel density, minimal inter-core crosstalk, excellent flexibility, and strong resistance to bending. Due to their high optical transmittance and biocompatibility, imaging fibres are widely used in medical fibre-optic endoscopy, allowing for real-time visualization and non-invasive optical biopsy of biological tissues at specific depths.

United States market for Imaging Fibre is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Imaging Fibre is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
