The global Immersion Freezer market size is predicted to grow from US\$ 106 million in 2025 to US\$ 124 million in 2031; it is expected to grow at a CAGR of 2.7% from 2025 to 2031.

Immersion Freezers are ideal for applications where low yield-loss is crucial. Food products are conveyed through a nitrogen bath for quick IQF freezing. They are designed for high-volume IQF applications (cooked poultry, diced/sliced meats, and seafood). Immersion freezers expose product directly to liquid nitrogen, achieving a rapid crust-freeze that locks in product yield and reduces cooking and/or processing losses.

An immersion freezer is a device used to quickly freeze food or other samples. It achieves rapid freezing by immersing the sample in extremely cold liquid. An immersion freezer requires a container to store a refrigerated liquid, usually using extremely low-temperature liquids such as liquid nitrogen, liquid argon, or a mixture of liquid argon and helium as the freezing medium. The product is submerged in a freezing liquid, allowing it to quickly contact the cryogenic surface of the liquid. The extremely low temperature of the liquid (usually tens of degrees Celsius to hundreds of degrees Celsius below zero) allows the sample to quickly reach the required freezing temperature. Due to the rapid freezing effect of the liquid, an ice layer is formed on the surface of the sample, which quickly takes away the heat, so that the inside of the sample is also rapidly frozen, thereby realizing rapid freezing.
